Generate "fake English" text from an RNN

Description:

Explore how the RNN model is able to generate text that resembles the training text by analyzing the weights and architecture of the RNN. Optionally, train the RNN themselves using a corpus of Shakespeare plays as the training set.
Understand how RNNs can model text. Introductory machine learning assignments often do not manage to make students gain intuition about why the models work.
The fun factor: Fun playing around with RNNs.
The assignment is open-ended: You can explore complex mechanisms for generating text that looks like a play written in English.
Dataset Links: https://cs.stanford.edu/people/karpathy/char-rnn/

PS: You can work on Colab , if you require more computational power
